

IN THE SPECIFICATION:

Please revise the specification as follows:

[0062] If the newly crawled web page is a regular web page or a temporary redirect page, the content filter determines (step 1450-2) the content fingerprint, *contentfp*, of the downloaded page, the source URL fingerprint, *src\_urlfp*, of the downloaded page, the target URL fingerprint, *trgt\_urlfp*, of the downloaded page, and the page rank or other query independent metric, *score*, of the downloaded page. If the newly crawled web page is a regular web page, both the source and target URL fingerprints are the URL fingerprint of the page. These parameters are then used to make procedure calls (steps 1470, 1480, 1490) to the Dupserver engine 322. The order of the procedure calls is not critical. In one embodiment, step 1490 is performed only if the newly crawled page is determined during steps 1470 and [[1490]] 1480 to be a canonical page. In another embodiment, the content filter makes a single procedure call to the Dupserver engine, which then performs steps 1470, 1480 and, when the prior steps determine that the page is a canonical page, 1490.
